

## 24. Prim's Algorithm (Minimum Spanning Tree)

### Aim:

To find Minimum Spanning Tree (MST) using Prim's algorithm.

### Algorithm:

1. Start from any vertex.
2. Pick the minimum edge that connects a visited vertex to an unvisited vertex.
3. Repeat until all vertices are included.

### CODE:

```
#include <stdio.h>
#define INF 9999
#define MAX 20

void prim(int G[MAX][MAX], int n) {
    int selected[MAX], no_edge = 0;
    int x, y;
    for (int i = 0; i < n; i++) selected[i] = 0;
    selected[0] = 1;

    printf("Edge : Weight\n");
    while (no_edge < n - 1) {
        int min = INF;
        x = y = 0;
        for (int i = 0; i < n; i++) {
            if (selected[i]) {
                for (int j = 0; j < n; j++) {
                    if (!selected[j] && G[i][j]) {
                        if (min > G[i][j]) {
                            min = G[i][j];
                            x = i;
                            y = j;
                        }
                    }
                }
            }
        }
    }
}
```

```

        }
    }
}
printf("%d - %d : %d\n", x, y, G[x][y]);
selected[y] = 1;
no_edge++;
}
}

int main() {
    int n, G[MAX][MAX];
    printf("Enter number of vertices: ");
    scanf("%d", &n);
    printf("Enter adjacency matrix (0 if no edge):\n");
    for (int i = 0; i < n; i++)
        for (int j = 0; j < n; j++)
            scanf("%d", &G[i][j]);

    prim(G, n);
    return 0;
}

```

## Output

```
Enter number of vertices: 5
Enter adjacency matrix (0 if no edge):
0 2 0 6 0
2 0 3 8 5
0 3 0 0 7
6 8 0 0 9
0 5 7 9 0
Edge : Weight
0 - 1 : 2
1 - 2 : 3
1 - 4 : 5
0 - 3 : 6

=== Code Execution Successful ===
```

## RESULT:

The program successfully executed and displayed the Prim's Algorithm.
